NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

 Priority application number
(*if you know it*)

 Date of filing
(*day / month / year*)

7. Divisionals, etc: Complete this section only if
this application is a divisional application or
resulted from an entitlement dispute (see note f)

 Number of earlier UK application
(*day / month / year*)

8. Is a Patents Form 7/77 (Statement of
inventorship and of right to grant of a patent)
required in support of this request?

YES

Answer YES if:

- a) any applicant named in part 3 is not an inventor, or
- b) there is an inventor who is not named as an applicant, or
- c) any named applicant is a corporate body.

Otherwise answer NO (See note d)

9. Enter the number of sheets for any of the following items you are filing with this form.
Do not count copies of the same document

Continuation sheets of this form

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- a) If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.
- b) Write your answers in capital letters using black ink or you may type them.
- c) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- d) If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- e) Once you have filled in the form you must remember to sign and date it.
- f) For details of the fee and ways to pay please contact the Patent Office.

DUPLICATE

DISPERSIONS

The present invention relates to an aphron dispersion.

5 An aphron dispersion is also known, especially in its concentrated form, as a polyaphron dispersion and a biliqid foam. This phrase is known, for example, from Sebba, F. (Felix), "Foams and biliqid foams, aphrons", 1987. ISBN: 0471916854. Biliqid foams are known in the art and are described in the following literature references by Sebba:

10 "Biliqid foams", J. Colloid and Interface Science, 40 (1972) 468-474; and "The Behaviour of Minute Oil Droplets Encapsulated in a Water Film", Colloid Polymer Sciences, 257 (1979) 392-396.

15 US-A-4,486,333 to Sebba describes a particular method for the preparation of biliqid foams by agitating a hydrogen bonded liquid containing a soluble surfactant to produce a gas foam and intermittently adding to the gas foam a non-polar liquid which is immiscible with the hydrogen bonded liquid, the surfactant-containing hydrogen bonded liquid being selected to provide a spreading coefficient equal to or greater than zero.

20 25 Previously aphron dispersions have been added to liquids or foam forming polymers to provide surface coating as disclosed, for example, in WO 99/05229. We have now surprisingly found that certain aphrons can be dispersed in solid or semi-solid surfactants.

30

Accordingly the present invention provides a solid composition comprising oil core aphrons dispersed in a solid surfactant.

5 Solid compositions comprising solid surfactants are, of course, well known. They can be used, for example, as soap or syndet bars, deodorants, anti-perspirants sticks, stain removers and many other uses. Such compositions can, for example, clean a variety of surfaces, such as the skin or
10 hair or household or domestic hard or soft surfaces or clothes, or can be used to moisturise the skin, for example to overcome problems of dryness and/or roughness. It is also known to add oils and oil soluble substances to such compositions to alter their function or aesthetics.
15 However, the range of substances which can be added is limited since there has to be a certain degree of compatibility between the surfactant and the oil or oil soluble substance. Furthermore the properties of the surfactant composition may be adversely affected,
20 particularly when relatively large quantities of oil are added. We have unexpectedly found that when oil core aphrons are dispersed in such a composition the original properties of the surfactant remain essentially unchanged or improved. Furthermore we have found that the properties of
25 the oil core, or any compounds contained therein, remains essentially unchanged and is not adversely affected by the surfactant composition. Additionally, the composition has a creamy and luxuriant feel. This can enable a relatively inexpensive soap or syndet bar to have a more expensive
30 feel.

A further problem with the prior art is that only a limited quantity of oil or other hydrophobic substances can be dispersed directly in a solid surfactant. If more than about 2 wt% of such an oil or substance is incorporated in 5 the surfactant the foam is substantially diminished and the surfactant substantially fails to maintain its function and can become virtually unusable. Another problem is that the surfactant often loses its solid processability. Furthermore, higher oil concentrations reduce the integrity 10 of the solid surfactant and its desired use qualities are reduced. In particular it softens and retains water, is consumed in use more rapidly and is aesthetically unpleasing. We have surprisingly found that when oil core 15 aaphrons are dispersed in such a surfactant, substantially more oil phase can be incorporated with minimal or reduced foam and/or function suppression. Furthermore the other difficulties discussed above can be alleviated or overcome.

The composition of the present invention is solid and 20 comprises a solid surfactant. Such components are well known. Thus the composition may, for example, be in the form of a solid or gel, preferably one which can simply be held in the hand.

25 Thus the composition can, for example, be in any form such as a tablet, stick, bar or granules or in any solid form capable of being moulded into these forms.

The solid surfactant may be, for example, a soap, in 30 particular a vegetable based soap or an alkali metal salt of a long chain fatty acid. Suitable long chain fatty acids contain from 8 to 24 carbon atoms in the long chain,

especially 12 to 18 carbon atoms. A preferred soap is a stearate such as sodium stearate.

The solid surfactant may also be a synthetic surfactant, for
5 example an anionic, cationic, amphoteric, nonionic or
zwitterionic surfactant. Examples of suitable surfactants
are sodium cocoate, sodium tallowate, sodium palm kernelate,
sodium palmitate, triethanolamine stearate, sodium cocoyl
isethionate, sodium isethionate, sodium dodecyl benzene
10 sulfonate and sodium cocoglyceryl ether sulfonate.

The surfactants can be used singly or in a combination of
two or more. Further surfactants may also be added. In
particular a soap and a synthetic surfactant may be used
15 together, for example to form a "combar".

The composition of the present invention also comprises oil
core aphrons. The internal phase of the aphrons is oil
based, that is to say hydrophobic. Preferred oil cores
20 comprise an oil, ester, an extract (for example from a
vegetable or plant) or other water insoluble liquid or
mixture thereof. Such oil cores may, for example, confers
an emollient, moisturising, conditioning or other cosmetic
or pharmaceutical benefit to the skin or hair. Suitable oil
25 phases are, for example, oils which are liquid at room
temperature (e.g. 20°C) such as, for example, one or more
selected from a cyclomethicone, dimethicone, dimethiconol,
dimethicone copolyol, an emollient ester such as isopropyl
stearate, lanolate, myristate or palmitate, or octyl
30 palmitate, a glyceride such as avocado oil, coconut oil,
soybean oil or sunflower oil, or a caprylic/capric
triglyceride, a lanolin oil, mineral oil or natural oil, or

oleyl alcohol, or any other oil known to be used in emulsions for whatever purpose. Also included in the definition of oil are water insoluble solvents such as hexane, toluene, benzene, kerosene, diesel oil and other like solvents and water-insoluble organic liquids. If necessary or desired, solvents and/or freezing point depression aids may be added, especially to ensure that the oils remain liquid at room temperature.

10 The aphron dispersion may be prepared by standard techniques known in the art, for example by those indicated herein.

Methods of producing biliquid foams are described in, for example, US-A-4,486,333, US-A-6,165,479 or WO 99/05229.

15 These involve the preliminary formation of a gas foam in order to provide a sufficiently large surface area on which the biliquid foam can subsequently be formed. It has been found that the prior formation of a gas foam is not required to manufacture a stable biliquid foam, provided that a suitable stirring mechanism is provided in the manufacturing vessel.

Such an apparatus comprises a tank provided with a stirrer in which the stirrer blade breaks the interface between the 25 liquid and air and provides low shear mixing throughout the whole of the volume of the biliquid foam throughout the whole of the production process. A delivery device is provided through which the internal phase of the dispersion, which in this case comprises at least two liquids, is 30 delivered to the tank. The design of the delivery device is such that the rate of addition of the internal phase fluid can be controlled and varied during the production process.

A feature of the production process is that the internal phase is added to the stirred external phase slowly at first until sufficient droplets have been formed to constitute a large, additional surface area for the more rapid formation 5 of new droplets. At this point, the rate of addition of the internal phase may be increased.

The production process preferably comprises the elements disclosed in WO 03/072687 and/or WO 03/064024.

10

It will be understood by those skilled in the art that other manufacturing methods for the aphon dispersion may be used, as appropriate.

15 The internal oil phase and/or the external phase in the remainder of the composition of the present invention may also comprise, for example, other components or additives. Thus either or both phases may, for example, comprise a further surfactant, such as a liquid surfactant, a
20 fragrance, colourant, natural or synthetic therapeutic agent, skin conditioner, a moisturiser, an anti-bacterial or anti-fungal agent, an opacifier, an oil or fat, a sugar, a pH adjuster, a pigment, a foam builder or a physiologically active, oil-soluble material. A suitable additive is, for
25 example, at least one of the anti-bacterial agents benzoyl peroxide, sulphur or a resorcinol such as triclosan or triclocarban, a vegetable oil such as olive oil, an acidic pH adjuster such as citric acid or lactic acid, sucrose, glycerine, the moisturiser sodium lauryl isethionate or the
30 opacifier titanium dioxide. The external phase may also comprise one or more solubilisers, dispersing agents and/or freeze-thaw protectors, for example solvents such as water,

an alcohol and/or a glycol. It is particularly preferred that the external phase comprises water, or a mixture of water and an alcohol, optionally together with a glycol.

5 The composition of the present invention may, as indicated above, comprise a relatively large amount of oil core aphrons. Preferably the composition comprises from 0.1 to 20 wt% oil core aphrons, more preferably from 0.5 to 15 wt% of the oil core aphrons, especially 2.5 or 5 to 15 wt% of
10 the oil core aphrons.

The composition may, for example, be in the form of a cosmetic, toiletry, pharmaceutical or household product. It may take the form of a stick, tablet, bar or granules.
15 Preferably the composition is in the form of a soap or syndet bar or a mixture thereof, a deodorant or anti-perspirant stick or a stain remover.

20 The compositions of the present invention may be formed simply by incorporating the oil core aphrons during the manufacturing process of the composition. Thus, for example, an oil core aphon dispersion can simply be added into the base composition, for example comprising the surfactant and any other components such as fragrance or colourant, and then the composition mixed and extruded
25 before being cut and stamped to a final shape.
Alternatively a transparent or translucent soap or syndet bar can be produced by a heat-melt-pour method, and the aphrons incorporated in the composition before it is poured.
30 The present invention will now be further described with reference to the following examples:

EXAMPLES

5 Example 1

Preparation of a stick deodorant

An aphron dispersion A was prepared from:

10	Peach Kernel Oil	30.0 parts
	Avocado Oil	30.0 parts
	Diisopropyl Adipate	29.1 parts
	Surfactant	1.0 part
	Water	9.9 parts.

15

Various non-alcoholic stick deodorants were then prepared from:

20	Propylene Glycol	66.0 parts
	Water	20.0 parts
	Cocamide MIPA	5.0 parts
	Sodium Stearate	8.0 parts
	Preservative	1.0 part
	Biliqid Foam A	0.5 - 10 parts

25

The propylene glycol, water, Cocamide MIPA and sodium stearate were mixed together and heated to 75 °C. The preservative was then added and the mixture mixed until a clear solution was obtained. After cooling to 65 °C the

30 aphron dispersion was added. The temperature was maintained at 65 °C while the mixture was filled into containers and allowed to set.

Example 2

Preparation of a stick deodorant

5 Various alcoholic stick deodorants were then prepared from
the following compositions using the method of Example 1:

Alcohol SDA-40	66.0 parts
10 Water	20.0 parts
Cocamide MIPA	5.0 parts
Sodium Stearate	8.0 parts
Preservative	1.0 part
Biliquid Foam A	0.5 - 10 parts

15

Example 3

20 Preparation of a syndet soap

An aphron dispersion B was prepared of aphrons containing sweet almond oil.

25 In a blender 85 to 99.5 parts of syndet soap base chips were added, and mixed thoroughly with 0.5 to 15 parts respectively of aphron dispersion B. The mixture was passed through a 3 roll mill, and then milled a second time. The mixture was then passed through a plodder and pressed into
30 bars.

Soap bars were also prepared in the same manner but by substituting the syndet soap base by a glycerine soap base or a hard milled soap base.

35

It was found that all the soaps maintained their soap lather and aesthetic properties even when the oil is incorporated in a relatively large amount.

5

Example 4

Preparation of a glycerin soap

10

In a vessel 85 to 99.5 parts of glycerin soap chips were added and melted until a clear solution was obtained. 0.5 to 15 parts respectively of aphon dispersion B were then added and mixed into the solution until the mixture was
15 uniform. The mixture was then poured into moulds and cooled.

It was again found that all the soaps maintained their soap lather and aesthetic properties even when the oil is
20 incorporated in a relatively large amount.

CLAIMS

1. A solid composition comprising oil core aphrons dispersed in a solid surfactant.

5

2. A composition according to claim 1 wherein the surfactant comprises at least one soap.

10 3. A composition according to claim 2 wherein the soap is a vegetable based soap or an alkali metal salt of a fatty acid containing 12 to 18 carbon atoms in the fatty chain.

15 4. A composition according to claim 3 wherein the soap is sodium stearate.

15

5. A composition according to any one of the preceding claims wherein the surfactant comprises at least one synthetic surfactant.

20 6. A composition according to claim 5 wherein the synthetic surfactant is sodium cocoate, sodium tallowate, sodium palm kernelate, sodium palmitate, triethanolamine stearate, sodium cocoyl isethionate, sodium isethionate, sodium dodecyl benzene sulfonate, sodium cocoglyceryl ether sulfonate or a mixture thereof.

25

7. A composition according to any one of the preceding claims which comprises 0.1 to 20 wt% of the oil core aphrons.

30

8. A composition according to any one of the preceding claims which also comprises water and/or an alcohol.

9. A composition according to any one of the preceding claims which also comprises a glycol.
- 5 10. A composition according to any one of the preceding claims wherein the oil core comprises an oil, ester or other water insoluble liquid or a mixture thereof which confers an emollient, moisturising, cleansing, conditioning or other cosmetic, personal care or pharmaceutical benefit to the
10 skin, hair or a fabric.
11. A composition according to any one of the preceding claims wherein the oil core comprises a fragrance, a colourant, a natural or synthetic therapeutic agent, a skin
15 conditioner, an anti-bacterial or anti-fungal agent or a physiologically active, oil-soluble component.
12. A composition according to any one of the preceding claims which further comprises at least one of a further
20 surfactant, a fragrance, a colourant, a natural or synthetic therapeutic agent, a skin conditioner, a moisturiser, an anti-bacterial or anti-fungal agent, an opacifier, an oil or fat, a sugar, a pH adjuster, a pigment or a foam builder.
- 25 13. A composition according to any one of the preceding claims which is in the form of a stick, tablet, bar or granules.
14. A composition according to any one of the preceding
30 claims which is a cosmetic, toiletry, household or pharmaceutical product.

15. A composition according to any one of the preceding claims which is a soap or a syndet bar, a combar, a deodorant, an antiperspirant stick or a stain remover.
